EDUCATION

University of California, Los Angeles

BS in Computer Science

September 2023 – Present (expected June 2027)

EXPERIENCE

Software Engineer Intern

June 2026 – September 2026

Archil

- Worked on a distributed filesystem optimized for agentic (low latency, high concurrency) workloads and high throughput data storage
- Optimized mounting the filesystem on multiple clients with a distributed leasing system, reducing per-write latency by cross-AZ latency (1-2 ms) and utilizing correctness tools (Antithesis) to ensure consistency
- Designed and implemented sandbox networking primitives, including a firewall with IP/domain filtering and credential brokering, enabling users to secure untrusted workloads, such as agents
- Implemented "serverless SQLite" on top of the distributed filesystem for multi-tenant systems that can scale to high read throughput

Software Engineer Intern

January 2026 – March 2026

Datacurve

- Architected an end-to-end data pipeline for a frontier AI lab to improve the performance of an LLM on machine learning tasks and delivered reinforcement learning environments
- Performed evaluation of frontier model to determine failure modes to target for data collection, quantifying the importance of each area of improvement
- Implemented comprehensive quality checks on collected data to ensure a high-quality reward for post-training a model
- Interfaced closely with researchers to understand model underperformance and data needs and standards

Software Engineer Intern

June 2025 – September 2025

Vercel

- Implemented request collapsing and origin shielding for Vercel's global Content Delivery Network impacting 25 requests/second, serving them from Vercel's distributed cache instead of the origin server
- Implemented a multilayered locking system which added greater cache coherency and intra-region and node synchronization
- Refactored the codebase to support streaming responses from the Vercel proxy to the client for a faster time to first byte

Software Engineer Intern

June 2024 – September 2024

Vercel

- Streamlined the process of creating and updating backend API services, enabling continuous deployments and reducing the time to deployment from up to a day to a few minutes
- Proposed and developed a reverse proxy handling over 3k requests/second to 80 backend services
- Utilized container orchestration and IaaS technology to manage the deployment of services
- Built a robust alert system for API services ingesting logs from distributed systems and catching 2 incidents
- Wrote internal documentation including an RFC and runbook

Project Lead

November 2021 – September 2023

tRPC

- Led the development of an open-source library making TypeScript server-client communication effortless
- Grew the project to 30,000 GitHub stars and 250,000 weekly downloads
- Co-led the development of a major version, optimizing TypeScript types to significantly reduce typechecking time and improve developer experience
- Developed codemods to automate migrations and framework integrations (Vite, Bun, etc.) to expand library usage

TECHNICAL SKILLS

Languages: Rust, Go, C++, JavaScript, TypeScript, Python, HTML/CSS, Java, SQL

Frameworks: Kubernetes, Terraform, AWS

Developer Tools: Git, Docker
